INTERNAL SCORING RUBRIC - Senior Data Engineer (Job ID: DJ-203)

SCORE SCALE

Scores are reported on a 0-100 scale with three criterion-referenced rating bands: strong_match (70-100), possible_match (40-69), and low_match (0-39). These bands align with the scoring pipeline's own thresholds, so the rubric and the scorer apply the same cut points.

MANDATORY REQUIREMENT

All mandatory conditions are required. A candidate missing any of them should not be rated above possible_match, and the score should not exceed 60.

- Experience in backend development and/or data engineering.
- Experience with at least one data-processing or pipeline tool such as Spark, BigQuery, Kafka or Airflow.
- Programming experience in at least one of Python, Java, Scala, SQL or Go.

PREFERRED CRITERIA

- Development and deployment on a cloud platform such as AWS
- Code deployment with GitHub, Kubernetes and Docker
- Machine learning, database systems or ads engineering background
- Support for project management tasks such as project updates and timelines

BASIS

Mandatory and preferred criteria are derived directly from the posted job requirements for this role.
